THE SCALE OF THE ANALYSIS BEHIND IT

39 years

of climate normals (NCM, 1977–2015) rebuilt into an 8,760-hour modelled year

8,760 hours

of sun position ray-traced against 131 trees for every hour of the year

15,000

one-metre ground cells modelled for shade and comfort, site-wide

4 models

trained and tested for leakage — two of them decide what this document reports

41 checks

run on every rebuild, so a wrong number fails loudly instead of shipping quietly

VERIFY THIS DOCUMENT

Every quantity in this file is regenerated from data by code. Nothing is typed by hand.

Repository github.com/wasim437/AI_SAFA

Live portal wasim437.github.io/AI_SAFA/

Produced by [src/plan.py](#) · [src/costing.py](#) · [src/climate.py](#)

Reproduce `python run_analysis.py` · `python -m tests.test_pipeline`

A ten-phase process, checked at every step

Nothing downstream is hand-drawn or hand-typed — change an input and every figure moves with it, or a test fails loudly.

OF 12

01

THE TEN PHASES

- P1 Site & Context Analysis**
39 years of NCM normals rebuilt into an 8,760-hour year, verified back to within 0.39 °C; sun position for every hour via NREL/pvlib; shadow geometry; 7,640 residents inside a ten-minute walk
- P2 Problem Definition**
Phase 1 findings turned into problems and scored by severity rather than listed flat — thermal discomfort dominates everything else
- P3 Opportunity & Objectives**
The ranked problems converted into measurable targets, including the comfort-hours target the finished design is scored against
- P4 Concept Development**
Multiple plan forms generated and swept against the solar model; the crescent selected on hours-with-no-shade, not on mean coverage
- P5 Masterplan Development**
Every room struck off the crescent's centre; areas taken as the shoelace area of the drawn polygon, so the schedule closes on 15,000 m²
- P6 Detailed Design**
The canopy section solved against shadow geometry — 7 m walk, 18 m gridshell at 4.5 m, 3 m southern louvre; 131 trees at mature canopy
- P7 Performance & Sustainability** ★ THIS DOCUMENT
Water balance, carbon, the canopy PV deficit, and ray-traced shade performance by zone
- P8 User Experience & Activation**
K-Means microclimate regimes and the hour-by-month comfort surface; programming targeted at late afternoon, spring and autumn
- P9 AI Workflow & Visualisation**
The four models and the anti-leakage discipline; drawings, boards, the analytics portal and the sixty-second film
- P10 Submission Assembly**
Every report and visual mapped onto the twelve upload slots, each with a manifest naming what produced it

Sustainability Concept & Strategy

Water, carbon, energy and shade — including where the scheme runs a deficit

A sustainability chapter that reports only its successes is not evidence, it is marketing. This one states the shortfalls in the same voice as the gains, because a jury that catches a single overclaim will re-examine every other number in the submission.

Upload slot 08 — Sustainability Concept & Strategy

Al Safa 2 Park · **Falaj Al Safa** · 15,000 m² · Al Safa 2, Dubai

Mohamed Wasim · Individual Applicant

Issued 03 August 2026

Every quantity in this report is regenerated from the project's analysis pipeline by `python run_analysis.py`. No figure quoted here is typed in by hand.

1. Thermal performance — the primary outcome

The scheme's largest environmental effect is that it makes outdoor space usable without mechanical cooling. Comfortable daylight hours rise from 44.5% to 64.6%; the mean heat-index reduction under the canopy is 7.13 °C; and peak heat index falls from 56.8 °C to 48.7 °C.

Share of the year's daylight hours in each comfort band, exposed today and shaded as designed. Analysis output — computed from project data.

2. Water

Al Falaj is a 0.9 m recirculating channel — about 105 m² of water surface in total. It is deliberately set on the canopy's drip line so that it is shaded all day, because an open channel in Dubai evaporates. **It is a channel, not a lagoon**, and the water argument in this report depends on it not being one.

- Irrigation is subsurface drip fed from treated sewage effluent, not potable supply.
- Planting is five desert species selected for drought tolerance; Ghaf takes the southern rank because it is the most drought-tolerant in the schedule.
- The falaj recirculates and is shaded for its whole length.

3. Energy — stated as the deficit it is

The canopy's photovoltaic array covers roughly 13% of the site's lighting and systems load. That is a deficit, not a surplus. An earlier draft of this project described the shortfall as power sold back to the grid. It is corrected here. The park is a net consumer of electricity. The honest claim is that shading reduces demand for mechanical cooling, not that the park pays for itself in kilowatt-hours.

4. Carbon, biodiversity and materials

131 trees across five species sequester carbon and, more importantly at this latitude, produce shade. The biodiversity wadi and the native planting strategy target habitat value rather than ornamental effect.

Annual shade coverage by zone type — ray-traced ground-plane occlusion sampled across the year. Analysis output — computed from project data.

5. What is conservative, and what is assumed

- **Diffuse radiation is excluded** from the shade model, so shaded comfort is stated conservatively — the real shaded condition is slightly better than reported, never worse.
- **The 6 °C shade relief is a literature value**, not a site measurement.
- **The climate series is modelled**, reconstructed from 39 years of monthly normals and verified back to within 0.39 °C. Conclusions are about a typical year, never about extremes.
- **Site-wide mean shade is 34.1%**, which is modest by design: the scheme concentrates its shade budget into one continuous, genuinely excellent route.

Every quantity above is regenerated by `python run_analysis.py` and asserted by `python -m tests.test_pipeline`, which runs 38 correctness checks across the geometry, the climate reconstruction, the trained models and the cost plan. Nothing in this report is typed in by hand.

Proof the analysis runs, and what it reports

These are the values the pipeline wrote on its last run, read straight out of the files it produced. The commands below regenerate every one of them from the published repository.

MEASURED RESULT	models/headline_metrics.json
Annual daylight hours modelled	4,402
Comfortable daylight hours — today	44.5%
Comfortable daylight hours — as designed	64.6%
Mean heat-index reduction under canopy	7.13 °C
Peak heat index, exposed	56.8 °C
Peak heat index, shaded	48.7 °C
Crescent Walk shaded, canopy and louvre	87.3%
Site-wide mean shade	34.1%
Trees planted	131

TRAINED MODELS, ON HELD-OUT TEST SETS	models/model_metrics.json
M1a Random Forest — shade surrogate, test R ²	0.9982
M1b Neural network — deployed surrogate, test R ²	0.9944
M2 Gradient Boosting — comfort band, test accuracy	97.5%
M3 K-Means — regimes selected by silhouette	k = 2
Training / validation / test split	10,500 / 2,250 / 2,250
Random seed, fixed for reproducibility	42

RUN IT YOURSELF

```
git clone https://github.com/wasim437/AL_SAFA.git
pip install -r requirements.txt
python run_analysis.py           # data, models, figures
python -m tests.test_pipeline    # 41 correctness checks
node docs/_PORTAL/selftest.js   # 64 portal checks
node tests/test_film.js         # every frame of the film
```

The checks assert what would otherwise drift silently: that the modelled climate reproduces the published normals it was built from, that no room overlaps another, that the areas close on 15,000 m², that the cost stays inside AED 35 M, and that no model can see its own answer in its inputs.

The complete project, and where to check it

Every one of the 129 links below is live. The repository holds the data as issued and as processed, the code, the trained models, the drawings and the tests, and it runs end to end with one command. A juror who wants to know where a number came from can be given a file path rather than an opinion.
