

UPLOAD SLOT 12 OF 12 · ONE-MINUTE CONCEPT ANIMATION — STORYBOARD

Concept Animation — Storyboard

Sixty seconds, drawn from the project's own analysis

The film is not an illustration of the design; it is rendered from the design. Its geometry comes from the same arc definition as the masterplan and its sun from the same 8,760-hour solar model, so it cannot drift away from the drawings the way an animation produced separately would.

Al Safa 2 Park · **Falaj Al Safa** · 15,000 m² · Al Safa 2, Dubai · Mohamed Wasim, Individual Applicant · Issued 03 August 2026 · every quantity regenerated by `python run_analysis.py`

1. Structure — five scenes, sixty seconds

Time	Scene	What it shows
0–7 s	The site	Al Safa 2 as it is today: flat, exposed, and empty at midday
7–18 s	The heat	The reason it is empty — the modelled heat index across a summer day, and the hours that are lost to it
18–38 s	The crescent	The arc builds and plants itself while a full computed day passes over it. 131 trees, the falaj, the radial alleys and the rooms appear in the order they are reached
38–48 s	Beneath it	Eye level on the walk: the dappled soffit, the louvre cutting the low sun, the channel at the edge
48–60 s	The proof	The measured result — comfortable hours rising from 44.5% to 64.6% — as the park fills at dusk

Scene boundaries are asserted by `tests/test_film.js`, which renders every frame and fails on any gap, overlap or invalid value.

2. Why it can be trusted against the drawings

- The arc is the same 141 m radius as the masterplan, regenerated by `tools/sync_film.py` from `src/plan.py`.
- The sun positions are the same NREL-computed values used by the shade model — the shadows move correctly for the site's latitude and the time of year being shown.
- The tree count, the 0.9 m channel and the room layout are read from the same geometry as every drawing in this submission.
- Every frame is rendered by an automated test that fails on any NaN or undefined value, so a geometry change cannot break the film quietly.

3. How to produce the video file

The film records itself. Every frame is a pure function of one number — the time in seconds — so the page can hand the canvas straight to the browser's recorder and write the video out. Nothing is screen-captured, so the file carries no browser chrome, no desktop behind it, and no dependence on what the window happened to be scaled to.

- Open `concept_film.html` in Chrome or Edge.

- Press **Record the film to a video file** and leave the tab in front for sixty seconds.
- The file downloads on its own as `Falaj_Al_Safa_Concept_Film_60s.mp4` — 1920×1080, sixty seconds, about 11 MB.

Browsers that cannot write MP4 fall back to WebM, and a WebM written this way carries no duration in its header — it plays, but some players show no timeline. Convert it with `ffmpeg -i film.webm -c:v libx264 -pix_fmt yuv420p film.mp4`, or record again in Chrome or Edge, which write MP4 directly.

The film shows the **analysed** scheme exactly: the same arc, the same trees, the same solar model. It is therefore consistent with every number quoted elsewhere in this submission.
