02

THE SCALE OF THE ANALYSIS BEHIND IT

39 years

of climate normals (NCM, 1977–2015) rebuilt into an 8,760-hour modelled year

8,760 hours

of sun position ray-traced against 131 trees for every hour of the year

15,000

one-metre ground cells modelled for shade and comfort, site-wide

4 models

trained and tested for leakage — two of them decide what this document reports

41 checks

run on every rebuild, so a wrong number fails loudly instead of shipping quietly

VERIFY THIS DOCUMENT

Every quantity in this file is regenerated from data by code. Nothing is typed by hand.

Repository github.com/wasim437/AI_SAFA

Live portal wasim437.github.io/AI_SAFA/

Produced by **CODE** [src/climate.py](#) [src/solar.py](#) **DATA** [data/raw/sources.json](#) **DOCS** [DATA_SOURCES.md](#)

Reproduce `python run_analysis.py` · `python -m tests.test_pipeline`

A ten-phase process, checked at every step

Nothing downstream is hand-drawn or hand-typed — change an input and every figure moves with it, or a test fails loudly.

11

OF 12

01 THE TEN PHASES

P1 Site & Context Analysis

THIS DOCUMENT

39 years of NCM normals rebuilt into an 8,760-hour year, verified back to within 0.39 °C; sun position for every hour via NREL/pvlib; shadow geometry; 7,640 residents inside a ten-minute walk

P2 Problem Definition

Phase 1 findings turned into problems and scored by severity rather than listed flat — thermal discomfort dominates everything else

P3 Opportunity & Objectives

The ranked problems converted into measurable targets, including the comfort-hours target the finished design is scored against

P4 Concept Development

Multiple plan forms generated and swept against the solar model; the crescent selected on hours-with-no-shade, not on mean coverage

P5 Masterplan Development

Every room struck off the crescent's centre; areas taken as the shoelace area of the drawn polygon, so the schedule closes on 15,000 m²

P6 Detailed Design

The canopy section solved against shadow geometry — 7 m walk, 18 m gridshell at 4.5 m, 3 m southern louvre; 131 trees at mature canopy

P7 Performance & Sustainability

Water balance, carbon, the canopy PV deficit, and ray-traced shade performance by zone

P8 User Experience & Activation

K-Means microclimate regimes and the hour-by-month comfort surface; programming targeted at late afternoon, spring and autumn

P9 AI Workflow & Visualisation

The four models and the anti-leakage discipline; drawings, boards, the analytics portal and the sixty-second film

P10 Submission Assembly

Every report and visual mapped onto the twelve upload slots, each with a manifest naming what produced it

UPLOAD SLOT 11 OF 12 · SITE ANALYSIS & HUMAN-CENTRIC RESEARCH

Site Analysis & Human-Centric Research

What the site is, who it serves, and what is wrong with it

A flat, largely exposed 15,000 m² neighbourhood park serving roughly 7,640 residents within a ten-minute walk. Its defining problem is not layout or planting: for 55.5% of daylight hours, standing outside on it is uncomfortable or worse.

Al Safa 2 Park · **Falaj Al Safa** · 15,000 m² · Al Safa 2, Dubai · Mohamed Wasim, Individual Applicant · Issued 04 August 2026 · every quantity regenerated by python run_analysis.py

1. Climate — the governing constraint

The analysis reconstructs an 8,760-hour year for the site from 39 years of National Centre of Meteorology monthly normals, with solar positions computed for every hour by the NREL algorithm at the site's coordinates. The reconstruction is verified back against the published normals to within 0.39 °C.

The climate series is modelled, not measured. The underlying record is 39 years long but is published as monthly normals; the hourly series is reconstructed from them and labelled as modelled everywhere it appears. Conclusions are about a typical year, never about extremes.

Dubai climate normals against the modelled heat index. Analysis output — computed from project data.

2. The problem, ranked rather than listed

Problem	Severity	Evidence
Thermal discomfort	Critical	Only 44.5% of 4,402 daylight hours are comfortable; peak heat index 56.8 °C
No continuous shaded route	Critical	A straight or fragmented shade strategy leaves 330 hours a year with no shade anywhere along the primary route
Exposed perimeter	High	Roads on the boundary contribute noise, glare and reflected heat with no intervening mass
Water and irrigation demand	High	Open water or irrigated turf in this climate carries a continuing evaporation and supply cost
Limited programme range	Moderate	Without comfort, no amount of programming produces use

Ranking by severity is what justifies making shade the organising idea rather than one strategy among several.

3. Who the park serves

Approximately 7,640 residents live within a ten-minute walk (Dubai Statistics Center, 2023). The neighbourhood is established and low-rise, with families, working adults, domestic staff and a significant older population. The user groups and their needs are set out in the User Experience and Activation Strategy.

Visitor demand is a scenario, not a prediction. No footfall data exists for this site. Demand figures are deliberately excluded from the machine learning suite, because a model trained on an assumed demand curve would only recover the assumption that produced it.

4. Where the site is comfortable, square metre by square metre

Predicted July afternoon heat index per m². The crescent reads as the coolest continuous route, and its concave side is measurably cooler than its convex face. Analysis output — computed from project data.

5. Opportunities the analysis identifies

- **One continuous shaded route is worth more than dispersed shade.** Permutation importance puts distance to the crescent far above every other geometric feature.
- **Comfort is predictable from the calendar.** At 97.5% accuracy from sun position and date alone, park operations need no sensor network.
- **The shoulder seasons are recoverable.** The comfort gain concentrates in late afternoon in spring and autumn — hours that are currently lost and are cheap to win back.
- **The perimeter is an asset.** A planted berm addresses noise, glare and heat simultaneously.

Fig01 climate and comfort

39 years of NCM normals rebuilt into an 8,760-hour year, and what that year feels like exposed and shaded

Dubai climate and what it feels like
