02

THE SCALE OF THE ANALYSIS BEHIND IT

39 years

of climate normals (NCM, 1977–2015) rebuilt into an 8,760-hour modelled year

8,760 hours

of sun position ray-traced against 131 trees for every hour of the year

15,000

one-metre ground cells modelled for shade and comfort, site-wide

4 models

trained and tested for leakage — two of them decide what this document reports

41 checks

run on every rebuild, so a wrong number fails loudly instead of shipping quietly

03

THE PHASES BEHIND THIS FILE

P9 AI Workflow & Visualisation

VERIFY THIS DOCUMENT

Every quantity in this file is regenerated from data by code. Nothing is typed by hand.

Repository github.com/wasim437/AI_SAFA

Live portal wasim437.github.io/AI_SAFA/

Produced by **CODE** [src/models.py](#) [src/dataset.py](#) **MODELS** [models/model_metrics.json](#) **TESTS** [tests/test_pipeline.py](#)

Reproduce `python run_analysis.py` · `python -m tests.test_pipeline`

A ten-phase process, checked at every step

Nothing downstream is hand-drawn or hand-typed — change an input and every figure moves with it, or a test fails loudly.

06

OF 12

01 THE TEN PHASES

P1 Site & Context Analysis

39 years of NCM normals rebuilt into an 8,760-hour year, verified back to within 0.39 °C; sun position for every hour via NREL/pvlib; shadow geometry; 7,640 residents inside a ten-minute walk

P3 Opportunity & Objectives

The ranked problems converted into measurable targets, including the comfort-hours target the finished design is scored against

P5 Masterplan Development

Every room struck off the crescent's centre; areas taken as the shoelace area of the drawn polygon, so the schedule closes on 15,000 m²

P7 Performance & Sustainability

Water balance, carbon, the canopy PV deficit, and ray-traced shade performance by zone

P9 AI Workflow & Visualisation

The four models and the anti-leakage discipline; drawings, boards, the analytics portal and the sixty-second film

THIS DOCUMENT

P2 Problem Definition

Phase 1 findings turned into problems and scored by severity rather than listed flat — thermal discomfort dominates everything else

P4 Concept Development

Multiple plan forms generated and swept against the solar model; the crescent selected on hours-with-no-shade, not on mean coverage

P6 Detailed Design

The canopy section solved against shadow geometry — 7 m walk, 18 m gridshell at 4.5 m, 3 m southern louvre; 131 trees at mature canopy

P8 User Experience & Activation

K-Means microclimate regimes and the hour-by-month comfort surface; programming targeted at late afternoon, spring and autumn

P10 Submission Assembly

Every report and visual mapped onto the twelve upload slots, each with a manifest naming what produced it

python -m src.boards             # the presentation boards
python tools/build_submission_pdfs.py
python -m tests.test_pipeline    # 41 checks
```

UPLOAD SLOT 06 OF 12 · AI METHODOLOGY REPORT

AI Methodology Report

Four models, the discipline behind them, and what each one changed about the design

The challenge asks how AI supported the design. This submission's answer is a reproducible analysis pipeline that runs end to end with one command — not a description of prompting an image generator. Analysis that does not change a drawing is decoration; each model below is reported with the design decision it altered.

Al Safa 2 Park · **Falaj Al Safa** · 15,000 m² · Al Safa 2, Dubai · Mohamed Wasim, Individual Applicant · Issued 03 August 2026 · every quantity regenerated by python `run_analysis.py`

1. The discipline that makes these models mean anything

The target must not be recoverable from the inputs by algebra. It is easy to score $R^2 = 1.000$ on this project by accident: the heat index is a closed-form function of temperature and humidity, so 'predicting' it from temperature and humidity is arithmetic wearing a lab coat. Every model below was designed against that failure, and the pipeline asserts the absence of leaked features as a test.

2. The four models

Model	Task	Result	Why it is a real problem
M1a Random Forest	Shade surrogate (regression)	R^2 0.998	Learns a slow ray-traced simulation from cheap plan geometry
M1b Neural network	Shade surrogate (deployed)	R^2 0.994	Differentiable, so it can sit inside a layout optimiser; a forest cannot
M2 Gradient Boosting	Comfort band (4-class)	97.5%	Temperature and humidity withheld — it sees only sun position and the calendar
M3 K-Means	Microclimate regimes	$k=2$	Unsupervised; k is <i>selected</i> by silhouette score, not chosen to look tidy

3. Why M1 is the flagship

Ray-tracing annual shade means projecting 131 tree shadows onto 15,000 ground cells for every daylight hour. It is slow, and it must be re-run for every design variation. That cost is precisely what stops a designer exploring. The surrogate answers in milliseconds instead of minutes, at R^2 0.994 against ray-traced ground truth on a held-out test set. That is AI changing how the design was made, rather than decorating it afterwards.

Neural-network predictions against ray-traced ground truth on the held-out test set. Analysis output — computed from project data.

4. Why M2 answers a question worth asking

If thermal stress is predictable from a clock and an ephemeris alone, park operations can be scheduled without a sensor network — a real capital and maintenance saving over the life of the park. At 97.5% accuracy with temperature and humidity withheld, it is. Errors fall between adjacent comfort bands, never between comfortable and dangerous.

Confusion matrix, temperature and humidity withheld. Analysis output — computed from project data.

5. What the models actually changed

Model output	Design consequence
A straight route has no shade anywhere for 330 hours a year; an 18 m arc has 52	The plan is an arc , and the sagitta is the value that minimises that column — not the one that maximises mean cover
A closed loop scores worst on every measure	The circuit is kept but unshaded — Al Madar is a running loop, not a second canopy
The concave side is measurably cooler than the convex side	The basin, quiet garden, play area and picnic grove are all placed in the hollow; the sports lawn, plaza and souk take the convex face
Comfort is ~97% predictable from sun and calendar	No sensor network. Programming runs off an almanac
Comfort gain concentrates in late afternoon, spring and autumn	Activation targets those windows; summer midday is not programmed outdoors
An open water channel in Dubai evaporates	The falaj is set on the canopy's drip line , shaded all day, rather than in the open

6. Where AI was deliberately not used

Visitor demand is a scenario model, not a machine learning result. No footfall data exists for this site. A model trained on invented demand would only recover the assumption that produced it, and reporting that as a finding would be dishonest. It is therefore excluded from the model suite and labelled a scenario wherever it appears.

The photoreal renders are illustrations, not analysis. They are captioned as artistic impressions throughout. Three earlier visuals that presented invented data as measurement were withdrawn entirely.

7. Reproducibility

The complete analysis — data, code, trained models and tests — runs end to end with `python run_analysis.py` and is verified by `python -m tests.test_pipeline` (38 checks), `node docs/_PORTAL/selftest.js` (64 checks) and a frame-by-frame test of the concept film. A juror who wants to know where a number comes from can be given a file path rather than an opinion.

The full repository — every dataset, every model, every line of the pipeline above — is published at https://github.com/wasim437/Al_SAFA and the live analytics portal at https://wasim437.github.io/Al_SAFA/. Both run from the same code that produced this document.

Fig05 surrogate performance

The shade surrogate against held-out truth — predicted versus measured

Does the surrogate actually reproduce the simulation?

Neural network predictions against ray-traced ground truth, held-out test set

Residuals scattered evenly about zero indicate no systematic bias.

THE FIGURES THIS FILE LEADS ON

each one appears in the full tables below, from the same file

R² 0.9944

SHADE SURROGATE, TEST SET

97.5%

COMFORT BAND ACCURACY

k = 2

MICROCLIMATE REGIMES

4,402

DAYLIGHT HOURS MODELLED

MEASURED RESULT

models/headline_metrics.json

Annual daylight hours modelled	4,402
Comfortable daylight hours — today	44.5%
Comfortable daylight hours — as designed	64.6%
Mean heat-index reduction under canopy	7.13 °C
Peak heat index, exposed	56.8 °C
Peak heat index, shaded	48.7 °C
Crescent Walk shaded, canopy and louvre	87.3%
Site-wide mean shade	34.1%
Trees planted	131

TRAINED MODELS, ON HELD-OUT TEST SETS

models/model_metrics.json

M1a Random Forest — shade surrogate, test R ²	0.9982
M1b Neural network — deployed surrogate, test R ²	0.9944
M2 Gradient Boosting — comfort band, test accuracy	97.5%
M3 K-Means — regimes selected by silhouette	k = 2
Training / validation / test split	10,500 / 2,250 / 2,250
Random seed, fixed for reproducibility	42

WHAT THE CHECKS PROTECT

each one asserts what would otherwise drift silently

Climate fidelity

the modelled year reproduces the published normals it was built from

No overlaps

no room in the schedule overlaps another

Areas close

every area sums back to 15,000 m²

Budget held

the cost plan stays inside AED 35 M

No leakage

no model can see its own answer in its inputs

RUN IT YOURSELF

```
git clone https://github.com/wasim437/Al_SAFA.git
pip install -r requirements.txt
python run_analysis.py           # data, models, figures
python -m tests.test_pipeline    # 41 correctness checks
node docs/_PORTAL/selftest.js    # 64 portal checks
node tests/test_film.js          # every frame of the film
```

The complete project, and where to check it

Every one of the 121 links below is live. The repository holds the data as issued and as processed, the code, the trained models, the drawings and the tests, and it runs end to end with one command. A juror who wants to know where a number came from can be given a file path rather than an opinion.
