

Transportation Analysis

Al Safa 2 Park — Roads, Metro, Bus, Cycling & Parking Context

1. Road Hierarchy (from master-plan location image)

Road	Classification	Relevance to Site
Sheikh Zayed Road (E11)	Primary arterial / national highway	Forms the park's east-side context edge; major barrier and noise source
Al Wasl Street	Secondary arterial	Runs along the site's north-west side
Al Manara Street	Secondary arterial	Runs along the south side of the district
Local streets (4C, 6C, 6D, 10C/D, 31A, 37A, St 27/35, B29, C14)	Local/residential access	Provide direct neighborhood access to the park

2. Metro (REAL SOURCED — RTA / Dubai Metro)

Attribute	Value (sourced)
Station	ONPASSIVE Metro Station
Line	Dubai Metro Red Line
Fare zone	Zone 2
Operator	Roads & Transport Authority (RTA)
Former name	Al Safa Metro Station (rebranded to ONPASSIVE in Jan 2023)
Location	Along Sheikh Zayed Road, in the Al Safa area
Nearby interchange	Al Quoz Bus Station within walking distance of the metro station

This is a genuinely significant, now-sourced finding: the station was literally named after this area ("Al Safa Metro Station") — confirming the park sits within the station's natural catchment. The station is east of the site across Sheikh Zayed Road; SZR remains a significant pedestrian barrier, so a quality crossing (bridge/underpass) is the key move to convert this real transit proximity into real walkable access. (Source: RTA / Dubai Metro data, retrieved via web search 2026-07-24.)

3. Bus, Cycling, Parking, Drop-off, Emergency Access

Mode	Status
Bus	No bus stop locations visible/labeled in provided graphic — data gap, requires RTA route data
Cycling	No dedicated cycle infrastructure visible in surrounding streets
Walking	Typical low-rise-residential walkable block pattern; east-west walkability constrained by SZR
Parking	No existing dedicated park parking visible/confirmed — brief requires this be addressed in the new design
Drop-off	Not confirmed from available materials — pending DWG or site visit
Emergency Access	Not confirmed — DWG (once converted) may show service/emergency routes

4. Summary

Confirmed context: strong arterial (SZR) and secondary road (Al Wasl, Al Manara) framing, metro proximity across a highway barrier, walkable residential local-street access. Genuine gaps: bus routes, existing parking capacity, drop-off zones, cycling infrastructure, emergency access — all logged for follow-up rather than assumed.
